functional verification is hard period no disagreement here but why is this so consider today's design how much of it is more or less automated from rtl to netlist to layout to silicon but all this automation depends upon having correct rtl input to start with and there is little or no automation to help with rtl creation it is hard enough for a designer to decide what rtl model he wants to build and then to describe that rtl model correctly in a hardware description language it is even more difficult for a verification engineer who can't read the designer's mind to verify that what the designer created not only represents the rtl model he had conceived but also that the rtl model is an appropriate one for the problem at hand what makes rtl modeling and verification difficult is concurrency it is easy to teach an engineer how to write procedural code that conforms to the synthesizable subset of a hardware description language what is hard is understanding how the engineer's procedural code interacts with other components in the design over time in fact until recently we lacked effective languages to describe concurrent behaviors the ieee 1850 property specification language psl is a language for the formal specification of concurrent systems the language is particularly applicable for writing assertions about hardware designs psl supports multiple verification paradigms including formal analysis simulation and acceleration emulation
